

Layers of The Rainforest

Research the layers of the rainforest and write something unique about each one. The forest floor has been done for you.

Emergent Layer

Canopy Layer

Understory Layer

Forest Floor

The lowest layer is the forest floor, covered with fallen leaves, branches, and decomposing plant matter. It receives very little sunlight, so few plants grow here. However, it is home to various insects, fungi, and small ground-dwelling animals like rodents and insects.
