

# URANUS

## FOUR THINGS YOU DIDN'T KNOW

Uranus is the seventh planet from the Sun and is located over 2.8 billion kilometers away.

Uranus was officially discovered in 1781 by the astronomer Sir William Herschel

The planet has a total of 27 known moons. The largest ones are named Miranda, Ariel, Umbriel, Titania, and Oberon.

Uranus experiences extreme seasons. Each pole spends about 42 years in continuous darkness, followed by 42 years of continuous sunlight.
